TEJ3M
Networking Assignment-Setting Up A Wireless Client Server Network

Name(s): Shoaib, Lucas Ha, Victor

Objective:

To set up a wireless client server (or peer to peer) network.

Details:

Part 1

A client server network is one in which one computer **serves** up resources to other computers. These resources could include files, emails, messages, gaming services etc. The other computer that requests these emails, messages, files, gaming services etc. is called the **client** computer. Each computer usually connects to each other through a central device like a **router**. The connection can be **wired** or **wireless**. Your job is to set up a **Server** on one computer and make it so that another computer(**Client**) can connect to it and use its services. The Client will connect to your network wirelessly. As a result you will need to provide an SSID and a password for your network.

In order for another user(**Client**) on your network to use your **Server** running on your computer they will need to know the IP address of your computer. Once they have this IP address they will have to use the client program to access the server's program/data/services. Oftentimes you will have to provide the user with additional information i.e. passwords, usernames etc. to be able to access the services on a server computer.

A great example of a client-server application is a webserver. This program runs on one computer (the Server) and hosts webpages that the client will request from a client computer using a web browser. All the client needs is the IP address of the server computer and the path to the file it wants to retrieve.

When everything has been tested and ready for public deployment you will provide me with following:

Server IP address:_____192.168.0.1_____
Wireless SSID:_____lucas basement_____
Wireless Password:_____12345beefwellington_____
Other (depending on the service to be provided i.e. server and *client software, settings etc.):
Provide links to where I can download the client software.

It is your group's job to solve any technical issues you find. You may have to do research to get a better understanding of the **server** you will be using. You will have to figure out how to set up the server as well as how a client will access it. Make sure to perform your own tests by using someone else's computer running the client software (you can use your cell phone but make sure you are not connected to any other networks i.e. your cell provider's internet connection). Once you are certain that it works then you will submit this file with the required info.

Note that all your routers have been reset and you will have to configure everything from scratch. Any further assistance I give you will lead to a deduction in marks.

Your group's job is to demo to your teacher as many client-servers as possible (up to a max of three). The more you demo the higher your mark. Some examples include the following:

a. Web servers
b. FTP servers
c. Email servers
d. Game Servers
e. Chat Servers
f. Other??

Part 2

Create a slideshow where you will discuss the steps you took to create a wireless client server network that provides one or more server services. Include labeled screenshots wherever possible. Make sure to highlight and explain as many networking terms as possible (particularly those bolded in this handout). Explain everything you did from the router setup for wireless networking to testing for connectivity between your router and your computer to finding, downloading and setting up the server programs to testing the servers and clients.

Marks

/25 A-You have followed all the requirements of this assignment. The information in your assignment is detailed and clear and demonstrates a high level understanding of networking. The network was set up and verified successfully.

/50 TI-you will be awarded full marks for successfully setting up the client-servers, the number of client-servers you were able to successfully demo and the complexity of the service and testing it via a client computer as well as setting up all the requirements without my assistance.
40 marks max→ 1 server, 45→ 2 servers, 50→ 3 servers, peer to peer network examples with be worth 2 marks less for each one demonstrated

/25 C-you created a slideshow outlining the process of creating a wireless client server network providing client-server services. The slideshow is detailed with labeled screenshots of every step required to do this. It is designed and laid out in a professional, well organized manner.

Sample Client Server Network: The Web Server
